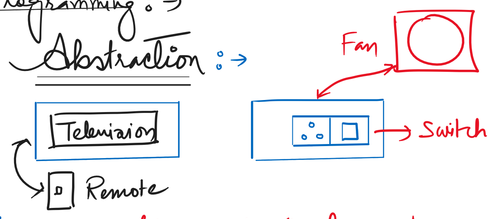
Pillars of Object Oriented Programming :→

(i) Encapsulation
(ii) Inheritance
(iii) Polymorphism
(iv) Abstraction

Abstraction :→



Implementation	Hiding : How it is done !
Functionality	Showing : What is happening !

Hiding the implementation details & only showing the functionality to the "end user" is called data abstraction. It is done for better UX (User Experience)

Abstraction can be achieved in two ways:

(i) Abstract Classes & Methods (0 – 100 %)
(ii) Interfaces (100 %)

```
abstract class Shape {
        abstract void area();
}

class Square {                    class Circle {

}                                 }
```

100 % Abstraction

Interface :→ An interface is a special block of code where we can have only "empty methods"

They behave like completely "abstract" classes. So, they are said to have 100 % abstraction.

```
class A ; Class B
Class C extends A, B {
    Not possible
}
```

```
interface A ; interface B
interface C implements A, B {
    possible
}
```

Icecream 1
String icecream();

Icecream 2
String icecream();

Icecream 3
String icecream();

Icecreams
⇓
Object :→ ButterScotch, Vanilla, Blueberry
